

Silver Gate Area- Wall Mountain

Date

Thu, 12/03/2020 - 20:32

This afternoon I wandered up to 8500 ft on a WSW aspect on what I believe is known as Wall Mountain, just SW of Republic. HS approached 1m in loaded areas, 50cm otherwise. This mid elevation terrain has poor structure with basal facets present under a 1F to 4F slab, and foot penetration was generally to the ground. There are also a variety of crusts on solar aspects increasing complexity.
