

Mineral Burn and Hayden Creek Basin

Date

Sat, 12/05/2020 - 12:00

Found some facets (didn't seem super developed) below an ice crust about 65cm down in the snowpack at the bottom of the mineral mountain northside burn. Got a fracture on this layer in our ECT but no propagation. Shovel shear showed a rough shear quality. Lots of surface hoar forming both in Sheep Creek and Hayden Creek.

Region

Northern Madison

Location (from list)

Sheep Creek

Observer Name

Jacob Zimmerer
