Activity

Skiing

While on a morning tour up to Ellis, we found generally stable conditions. We dug a quick pit up in the burn and noticed two problematic layers to watch in the future, a crust layer near the bottom of the pit which was on top of 5 or so inches of facets. The second layer was about 1/3 from the top of the snowpack below this weeks snowfall. We did not find propagation, but curious to see how it handles more loading. The ski out is “sporty” to say the least.

Region

Northern Gallatin

Location (from list)

Mt Ellis

Observer Name

Tommy S
