

# Avalanche in N. Bridgers

Date

Sat, 03/12/2022 - 15:20

Activity

Skiing

Snowboarding

Upon descending a ~35 degree slope, I (the snowboarder) kicked loose a wind slab that propagated 100 feet wide, 8 inch deep (max, 4 inches at edges) wind slab that traveled approximately 300 feet (entire slope over 30 degrees) before settling in 2 debris fields, each about 30' wide and with a maximum of 2' depth.

No one was swept by the debris/buried/injured.

After I cleared the path, my partner descended in my track, still attempting to cut any lower layers loose. As he was descending, he got swept by some loose slough and fell briefly, able to regain control and continue down the aspect.

Region

Bridger Range

Location (from list)

BRIDGER RANGE

Observer Name

Brittney Manning
