Activity

Skiing

Hello again from the Yellowstone Fx team! Just wanted to keep sharing some info with this poor structure. ECTP9 on a SW aspect at 8,800' this time farther South around the East entrance. Tracking some surface hoar and radiation recrystallization as it gets buried with this system. Yay new snow.

Question: we're seeing like pencil hardness depth hoar/melt forms at the base in some places. I've just not use to see depth hoar that's this hard and melted together. Curious what you would call it.

Enjoy the Holiday Weekend!

Location (from list)

Yellowstone Park NE

Observer Name

Jacob Peterson
