

New snow in wolverine bowl

Date

Fri, 02/09/2024 - 13:00

Activity

Snowboarding

Went for a quick tour into wolverine bowl today. Found new snow totals of around a foot in most places and a very thin melt freeze crust from high-pressure system on all shadier aspects while sunnier aspects had more of a noticeable crust beneath the new snow. Dug a 130 cm pit adjacent to the refrigerator chutes and got a CT15 Q1 @ 99cm and CT21 Q1 @ 30cm. Shallower result failed on facets beneath the recent melt freeze while the deeper result failed on the old melt freeze interface from earlier this season. Snow was coming down heavy by the time I left the bowl and wind was calm.

Region

Bridger Range

Location (from list)

Wolverine Bowl
